HematoVision

Advanced Blood Cell Classification Using Transfer Learning | Team: TSK841298 | 27 February 2026

Customer Journey Map

SCENARIO
Uploading, classifying, reviewing & reporting blood smear images
· HematoVision ·

	Entice How does the user first discover HematoVision?	Enter What does the user experience as they begin using the system?	Engage In the core moments of use, what happens?	Exit What does the user typically experience as they finish?	Extend What happens after the core experience is over?
Steps What does the user typically experience?	Hears about HematoVision from a colleague Reads AI article or sees conference talk on blood AI Hospital IT team demos the system	Receives login credentials from lab administrator Logs in to HematoVision web portal Completes onboarding video & guided tutorial	Uploads blood smear image (JPG/PNG) System runs CNN inference on image Views cell type & confidence score result Overrides or confirms AI prediction	Downloads diagnostic report PDF or CSV Reviews case dashboard & statistics	Receives model update email notification Browses past cases in profile history Gets recommended similar case studies
Interactions People · Places · Tools at each step	Peer clinician / pathologist referral Medical journal or conference booth/webinar HematoVision marketing website or brochure	Email with login link & credentials Web portal login + onboarding tooltips Lab admin for account configuration	Web upload interface (drag & drop) Automated CNN model backend Results dashboard & visualisation charts Pathologist for peer review / manual override Digital microscope scanner hardware	PDF/CSV report download screen Dashboard with charts & trend analytics Email notification on completion	Email digest of new model features & release notes Case history profile screen Recommendation engine via portal
Goals & Motivations 'Help me...' or 'Help me avoid...'	Help me learn if AI truly improves my diagnostics Help me see if this fits into my workflow	Help me start without a steep learning curve Help me trust that patient data will stay secure	Help me classify blood cells fast with >=90% accuracy Help me correct the AI when I disagree Help me process many cases efficiently	Help me produce a clear shareable report Help me avoid missing any critical findings	Help me track past cases at a glance Help me stay current with model updates
Positive Moments Steps the user finds enjoyable or exciting	Exciting to see AI match expert-level speed Peer referral feels highly credible	Tutorial is clear and well-paced Modern UI feels familiar and clean	Confidence score gives reassuring transparency Results in <5s feels impressively fast >=90% accuracy matches expert baseline	Clean PDF report impreses referring physicians Dashboard charts make trends immediately visible	Case history feels like a personal clinical logbook Model update alerts feel proactive and modern
Negative Moments Steps the user finds frustrating or confusing	Hard to verify accuracy without a live trial Privacy concerns about uploading patient images	Account setup has too many form fields Tutorial is long: most users skip it	Low-quality images cause cell misclassifications No explanation for WHY the AI made its prediction No batch upload: one image at a time is slow	Report takes >30s to generate; breaks flow Clinicians unsure how to securely share report	Feedback process felt verbose and bureaucratic Recommendations not always relevant
Areas of Opportunity How might we improve each step?	Free trial: 20 images, no sign-up required Publish accuracy benchmarks on homepage Create 90-sec demo video of live classification	Reduce setup to 3 steps maximum Add interactive tutorial with real sample images	Add Grad-CAM heatmaps to show WHY AI predicts Enable batch upload: up to 50 images at once Flag low-confidence cases for mandatory pathologist review	Auto-generate report in under 10 seconds Secure one-click share via hospital email	1-tap star rating to cut review friction Fortnightly personalised case study digest Alert when newer model available to deploy
